

# GMO's -Genetically, modified, Organisms. WHY are they bad?

GMO's have been spliced by inserting ECOLI into the DNA to break the sequence, once that is done a code is entered into the gene such as ROUND UP and terminator genes to sterilize the seeds. That chemical is then genetically bred inside the seed to be immuned to being spray by round up. These seeds are then heavily sprayed by this harmful chemical, 1 molecule away from Agent Orange. Food crops are heavily sprayed by Round up to force them to seed and to the market faster. Consuming round up is linked to many health issues such as: auto immune problems, diseases, autism, cancer, endocrine & hormonal problems, obesity, leaky gut, diverticulitis, sterility/infertility, parkinsons, & lymphoma.
